

LD Triggerz - v1.0.3

Exclusive Release

Hey everyone - thank you for the support. This one has been in the works for a while and I'm glad to finally get it in your hands.

LD Triggerz is a system-agnostic automation module for Foundry VTT. The short version: you define when something should happen, and what should happen when it does. HP drops below half? Apply Bloodied. HP hits zero? Apply Unconscious. Stat recovers? Remove the condition automatically. All of it configured through a GM Hub UI directly inside Foundry - no code, no macros required unless you want them.

What's in v1.0.3:

GM Hub with visual Trigger Builder and Condition Builder

Full Foundry ActiveEffect support - modes, changes, priority

Condition linking - wire a condition to an apply trigger and a remove trigger so full workflows run on their own

Custom System Builder path normalization for system.props attributes

Percentage-based comparisons - for example HP less than 25% of max

Scope filtering: all actors, PC only, NPC only

Actor path value comparisons - compare one stat against another

Import and Export for saving and sharing your automation setups

Scene control launcher and settings menu access

Foundry v13 and v14 support

System agnostic - works with any game system

How to Install: Download the zip from this post and install manually through Foundry's Add-on Module manager. Use Install Module and either paste the manifest URL or upload the zip directly.

This release is exclusive to Lisa's Dungeon supporters. If you find bugs or want to share how you're using it, drop a comment below - I read everything. More coming. Thank you.
