

LD TRIGGERZ

Trigger-driven automation for Foundry VTT - built for GMs who want their table to run itself.

Set the Rule. Forget the Busywork.

Define when something happens. LD Triggerz handles the rest.

HP drops below half - Bloodied applies automatically.

HP hits zero - Unconscious fires. Zero-skip keeps it clean.

Stat recovers above the line - the condition lifts on its own.

No macros. No scripts. No interrupting the game to manage status effects by hand.

The GM Hub

One window. Full control. Build triggers, build conditions, link them together, manage selected tokens - all from inside Foundry. No JSON, no external tools. Select a token, assign a condition, watch your automation rules work live at the table.

Built for Any Table:

System agnostic - Foundry v13 and v14 ready

Custom System Builder support with native system.props path math

Percentage comparisons and scope filters

Macro integration for when you need that extra step

Import and export your full configuration as JSON - take your setups anywhere

Available now from Lisa's Dungeon.
