

LD Triggerz

Release - System-Agnostic Trigger Automation for Foundry VTT v13/v14

Hey everyone. Dropping this for supporters first before any public release. LD Triggerz is now live.

What it does: LD Triggerz is a trigger-driven automation module for Foundry VTT. You define rules that watch actor and token data - HP drops below a threshold, a stat hits zero, a value crosses a percentage - and the module fires automatically. Apply a condition, remove it, toggle it, or run a macro. No scripting required.

Key Features:

Visual GM Hub - build triggers and conditions directly in-game through a clean UI, no JSON editing needed

Condition Builder with full Foundry ActiveEffect support - set attribute changes, modes, and priority right from the hub

Condition linking - wire a condition to an Apply Trigger and a Remove Trigger so the whole workflow runs hands-free

CSB support - Custom System Builder users get native system.props path math

Scope filtering - fire only on PCs, only on NPCs, or on everything

Percentage comparisons - trigger when HP drops below 25% of max, not just a raw number

Import and Export - save and share your entire trigger and condition configuration as JSON

System agnostic - runs on any Foundry system with no dependencies

Foundry v13 and v14 compatible

Example Use Cases:

Auto-apply Bloodied when HP hits 50%

Auto-apply Unconscious when HP reaches 0 - zero-skip keeps it from looping

Auto-remove a condition when a stat recovers above a threshold

Fire a macro when a specific actor path changes

This is a release from Lisa's Dungeon. If you're a supporter, grab it from the post. Feedback is welcome - especially from anyone running unusual systems who wants to stress-test the CSB path handling.
